

MySQL - RDBMS

Trainer: Mr. Nilesh Ghule

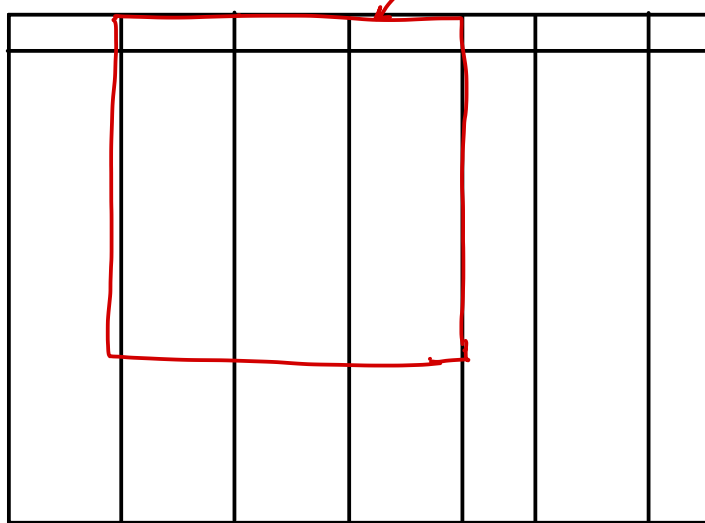

Views

- RDBMS view represents view (projection) of the data.
- View is based on SELECT statement.
- Typically it is restricted view of the data (limited rows or columns) from one or more tables (joins and/or sub-queries) or summary of the data (grouping).
- Data of view is not stored on server hard-disk; but its SELECT statement is stored in compiled form. It speed up execution of view.

→ each query on view will internally execute select query first. & process on top of it.

view

Create view view_name
AS SELECT ;

Views

- Views are of two types: Simple view and Complex view
- Usually if view contains computed columns, group by, joins or sub-queries, then the views are said to be complex. DML operations are not supported on these views.
- DML operations on view affects underlying table.
- View can be created with CHECK OPTION to ensure that DML operations can be performed only the data visible in that view.

Cannot perform
DML operations

View

- Views can be differentiated with: SHOW FULL TABLES.
- Views can be dropped with DROP VIEW statement.
- View can be based on another view.

*create view view2 as
select * from view1 where —;*

- Applications of views
 - ✓ Security: Providing limited access to the data.
 - ✓ Hide source code of the table.
 - ✓ Simplifies complex queries.

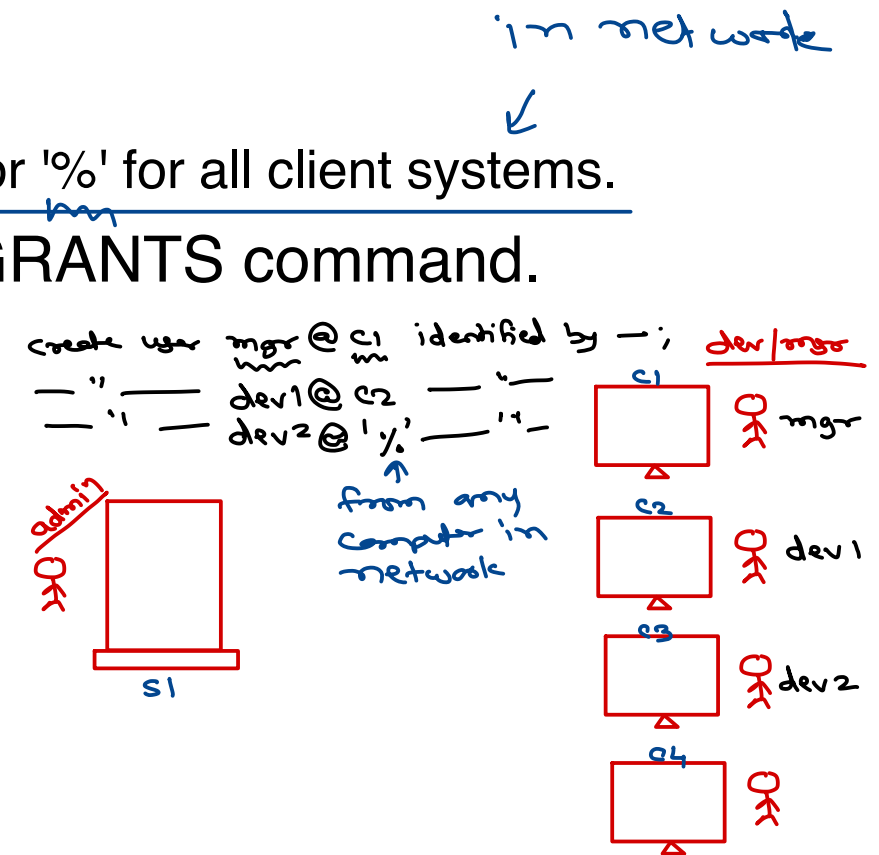

Data Control Language

- Security is built-in feature of any RDBMS. It is implemented in terms of permissions (a.k.a. privileges).
- There are two types of privileges.
- System privileges
 - Privileges for certain commands i.e. CREATE, ALTER, DROP, ... ← *structural changes*
 - Typically these privileges are given to the database administrator or higher authority user. ↑ *eg. project manager*
- Object privileges
 - RDBMS objects are table, view, stored procedure, function, triggers, ...
 - Can perform operations on the objects i.e. INSERT, UPDATE, DELETE, SELECT, CALL, ... ↑ *data*
 - Typically these privileges are given to the database users. ↑ *developers*

User Management

- User management is responsibility of admin (root).
- New user can be created using CREATE USER.
 - CREATE USER user@host IDENTIFIED BY 'password';
 - host can be hostname of server, localhost (current system) or '%' for all client systems.
- Permissions for the user can be listed using SHOW GRANTS command.
 - SHOW GRANTS FOR user@host;
- Users can be deleted using DROP USER.
 - DROP USER user@host;
- Change user password.
 - ALTER USER user@host IDENTIFIED BY 'new_password';
 - FLUSH PRIVILEGES;

Data Control Language

- Permissions are given to user using GRANT command.
 - GRANT CREATE ON db.* TO user@host; *global - on all db.*
 - GRANT CREATE ON *.* TO user1@host, user2@host;
 - GRANT SELECT ON db.table TO user@host;
 - GRANT SELECT, INSERT, UPDATE ON db.table TO user@host;
 - GRANT ALL ON db.* TO user@host;
- By default one user cannot give permissions to other user. This can be enabled using WITH GRANT OPTION. *→ similar to "root".*
 - GRANT ALL ON *.* TO user@host WITH GRANT OPTION;
- Permissions assigned to any user can be withdrawn using REVOKE command.
 - REVOKE SELECT, INSERT ON db.table FROM user@host;
- Permissions can be activated by FLUSH PRIVILEGES.
 - System GRANT tables are reloaded by this command. Auto done after GRANT, REVOKE.
 - Command is necessary if GRANT tables are modified using DML operations.

DDL – ALTER statement

- ALTER statement is used to do modification into table, view, function, procedure, ...
- ALTER TABLE is used to change table structure.
- Add new column(s) into the table.
 - ALTER TABLE table ADD col TYPE;
 - ALTER TABLE table ADD c1 TYPE, c2 TYPE;
- Modify column of the table.
 - ALTER TABLE table MODIFY col NEW_TYPE;
- Rename column.
 - ALTER TABLE CHANGE old_col new_col TYPE;
- Drop a column
 - ALTER TABLE DROP COLUMN col;
- Rename table
 - ALTER TABLE table RENAME TO new_table;

PSM - Agenda - Persistent Storage Module.

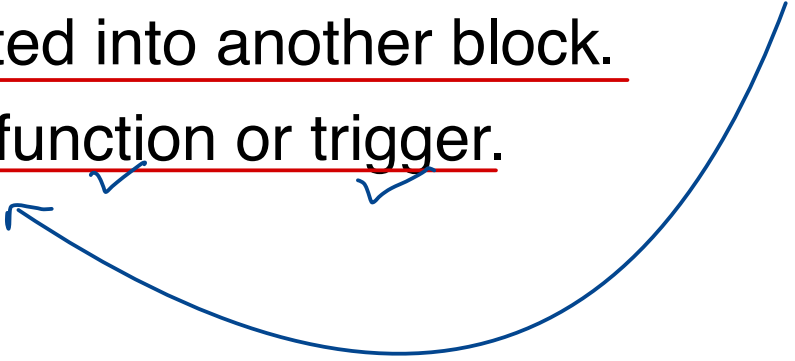

- MySQL Programming
- ✓ • Stored procedure
- ✓ • Exceptions
- ✓ • Function
- ✓ • Trigger

program → set of instructions

MySQL program → set of SQL statements.
↓
along with programming constructs e.g.
loops, if-else, ...

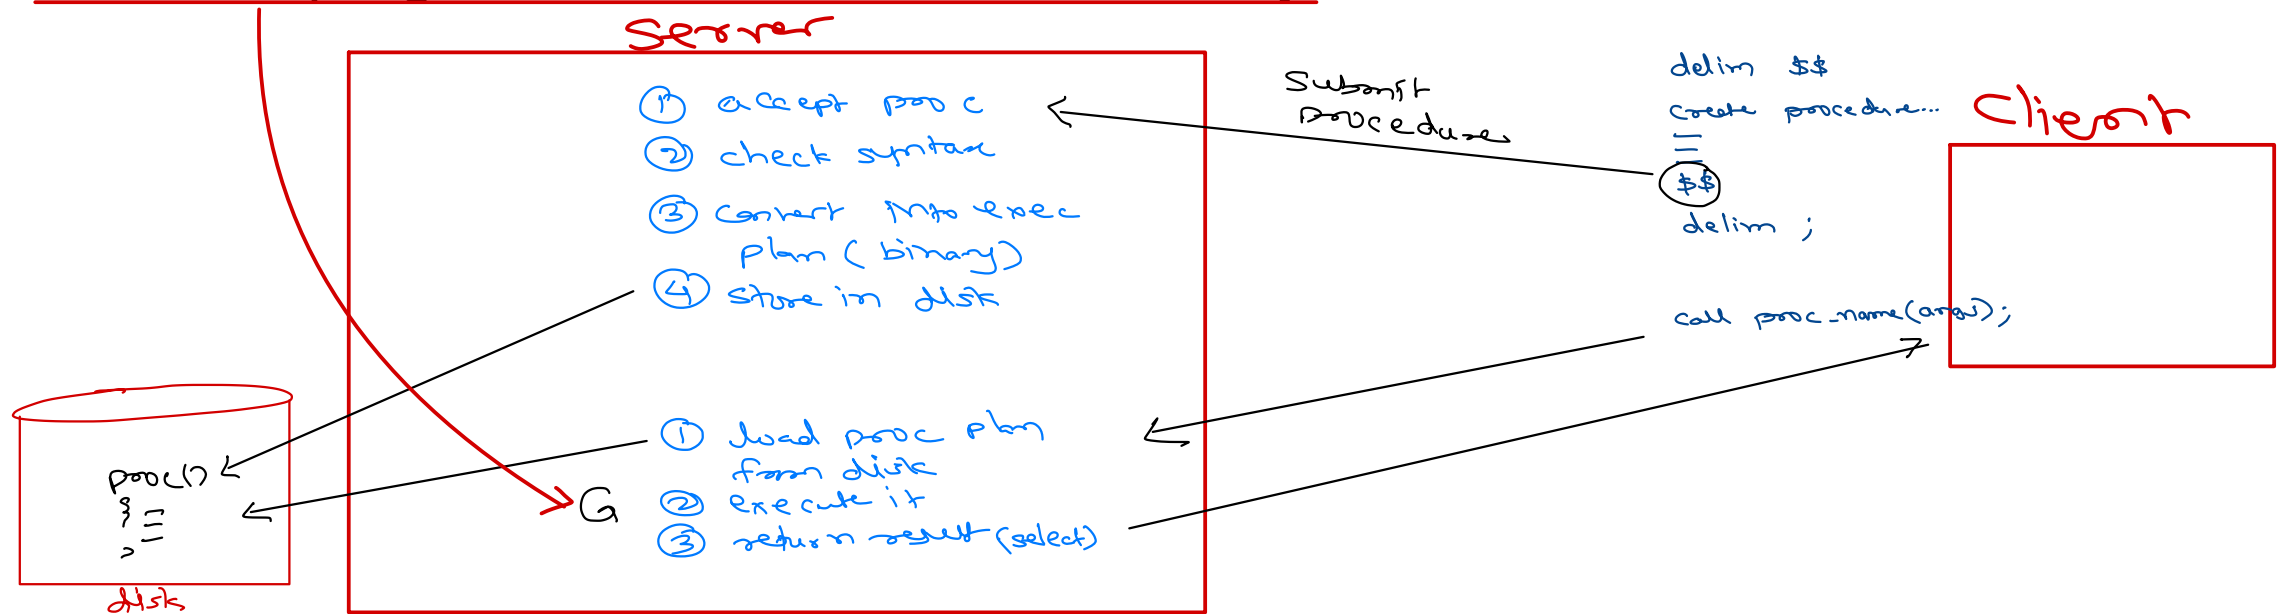

MySQL Programming

- RDBMS Programming is an ISO standard – part of SQL standard – since 1992.
 - SQL/PSM stands for Persistent Stored Module.
 - Inspired from PL/SQL - Programming language of Oracle.
 - PSM allows writing programs for RDBMS. The program contains set of SQL statements along with programming constructs e.g. variables, if-else, loops, case, ...
 - PSM is a block language. Blocks can be nested into another block.
 - MySQL program can be a stored procedure, function or trigger.
- 

MySQL Programming

- MySQL PSM program is written by db user (programmers).
- It is submitted from client, server check syntax & store them into db in compiled form.
- The program can be executed by db user when needed.
- Since programs are stored on server in compiled form, their execution is very fast.
- All these programs will run in server memory.

Stored Procedure

- Stored Procedure is a routine. It contains multiple SQL statements along with programming constructs.
- Procedure doesn't return any value (like void fns in C).
- Procedures can take zero or more parameters.
- Procedures are created using CREATE PROCEDURE and deleted using DROP PROCEDURE.
- Procedures are invoked/called using CALL statement.
- Result of stored procedure can be
 - returned via OUT parameter.
 - inserted into another table.
 - produced using SELECT statement (at end of SP).
- Delimiter should be set before writing SQL query.

Stored Procedure

```
CREATE TABLE result(v1 DOUBLE, v2 VARCHAR(50));
```

```
DELIMITER $$
```

```
CREATE PROCEDURE sp_hello()
```

```
BEGIN
```

```
    INSERT INTO result VALUES(1, 'Hello World');
```

```
END;
```

```
$$
```

```
DELIMITER ;
```

```
CALL sp_hello();
```

```
SELECT * FROM result;
```

```
-- 01_hello.sql (using editor)
```

```
DROP PROCEDURE IF EXISTS sp_hello;
```

```
DELIMITER $$
```

```
CREATE PROCEDURE sp_hello()
```

```
BEGIN
```

```
    SELECT 1 AS v1, 'Hello World' AS v2;
```

```
END;
```

```
$$
```

```
DELIMITER ;
```

```
SOURCE /path/to/01_hello.sql
```

```
CALL sp_hello();
```

Stored Procedure – PSM Syntax

VARIABLES

```
DECLARE varname DATATYPE;  
DECLARE varname DATATYPE DEFAULT init_value;  
SET varname = new_value;  
SELECT new_value INTO varname;  
SELECT expr_or_col INTO varname FROM table_name;
```

PARAMETERS

```
CREATE PROCEDURE sp_name(PARAMTYPE p1 DATATYPE)  
BEGIN  
    ...  
END;  
  
-- IN param: Initialized by calling program.  
-- OUT param: Initialized by called procedure.  
-- INOUT param: Initialized by calling program and  
-- modified by called procedure  
-- OUT & INOUT param declared as session variables.
```

```
CREATE PROCEDURE sp_name(OUT p1 INT)  
BEGIN  
    SELECT 1 INTO p1;  
END;  
  
SET @res = 0;  
CALL sp_name(@res);  
SELECT @res;
```

IF-ELSE

```
IF condition THEN  
    body;  
END IF;  
-----  
IF condition THEN  
    if-body;  
ELSE  
    else-body;  
END IF;  
-----  
IF condition THEN  
    if1-body;  
ELSE  
    IF condition THEN  
        if2-body;  
    ELSE  
        else2-body;  
    END IF;  
END IF;  
-----  
IF condition THEN  
    if1-body;  
ELSEIF condition THEN  
    if2-body;  
ELSE  
    else-body;  
END IF;
```

LOOPS

```
WHILE condition DO  
    body;  
END WHILE;  
-----  
REPEAT  
    body;  
UNTIL condition  
END REPEAT;  
-----  
label: LOOP  
IF condition THEN  
    ...  
    LEAVE label;  
END IF;  
...  
END LOOP;
```

CASE-WHEN

```
CASE  
WHEN condition THEN  
    body;  
WHEN condition THEN  
    body;  
ELSE  
    body;  
END CASE;
```

SHOW PROCEDURE

```
SHOW PROCEDURE STATUS  
LIKE 'sp_name';  
  
SHOW CREATE PROCEDURE sp_name;
```

DROP PROCEDURE

```
DROP PROCEDURE  
IF EXISTS sp_name;
```

Thank you!
